Stem Cells and Cloning: Advances and Applications

Gene cloning is making of multiple copies of a single gene, by which we can make a pure copy of individual gene. These cloning have been used in many sectors of biomedical and industrial research. Alteration of the gene sequence for the production or change of protein product or cloning of genes into new organism is the main domain process of ...

According to the National Institutes of Health, for this type of cloning, also known as reproductive cloning, scientists remove a mature somatic cell (any type of cell, except a sperm or egg cell) from the animal the scientists wish to copy. The desired DNA is then transferred into an egg of the same species that has had its own DNA removed.

HISTORY OF CLONING. Cloning is the outcome of the hard works on use of genetic engineering in animal breeding, treatment of hereditary diseases in human and replicating organisms. 16 In 1901, transfer of nucleus of a salamander embryonic cell to a enucleated cell was successfully undertaken. During 1940-1950, scientists could clone embryos in mammals.

The success rate in cloning is quite low: most embryos fail to develop, and many pregnancies end in miscarriage. Current efforts at human cloning are focused on creating embryonic stem cells for research and medicine, as described above. However, many feel that this type of therapeutic cloning comes dangerously close to human reproductive cloning.
