Applied mechanics (also engineering mechanics) is a branch of the physical sciences and the practical application of mechanics. Pure mechanics describes the response of bodies (solids and fluids) or systems of bodies to external forces. Some examples of mechanical systems include the flow of a liquid under pressure, the fracture of a solid from an applied force, or the vibration of an ear in ...

Statics is the branch of mechanics that is concerned with the analysis of loads (force and torque, or "moment") acting on physical systems that do not experience an acceleration ($a=0$), but rather, are in static equilibrium with their environment. When in static equilibrium, the acceleration of the system is zero and the system is either at rest, or its center of mass moves at constant velocity.

Figure 3 Loops generated using the condition of a constant centripetal acceleration $a_c = 3g$ matched to a circular arc covering the top 0°, 60°, 120° and 180°, respectively. The loops are normalised to give the same distance between the highest point and the "intersection". The widest loop is then obtained for the matching where the track is vertical and the narrowest when the condition is ...

De facto, sempre que dois objetos diferentes entram em contato muito próximo, passam elétrons dos átomos de um dos objetos para o outro. O objeto que for mais susceptível a perder elétrons ficará eletrizado com carga positiva (n prótons a mais) e o objeto que for menos susceptível a perder os seus elétrons ficará com a mesma carga, mas negativa (n elétrons a mais).
